The Φ_3^4 equation

Our goal: Prove that Φ_3^4 measure is invariant for Φ_3^4 equation

• Spatially periodic Φ_3^4 equation on $\mathbb{R}_+ \times \mathbb{R}^3$ is

 $\partial_t \Phi = \Delta \Phi + \infty \Phi - \Phi^3 + \xi$

where ξ is space-time white noise, i.e. random Gaussian field,

 $\mathbb{E}\xi(t,x)\xi(s,y) = \delta_{t-s}\delta_{x-y}$

- Problem: Low regularity of noise: $\xi \in C^{-\frac{5}{2}-} \Rightarrow \Phi \in C^{-\frac{1}{2}-} \Rightarrow \Phi^3$ is undefined!
- The bilinear map

$$\mathcal{C}^{\alpha} \times \mathcal{C}^{\beta} \ni (u, v) \mapsto uv$$

is well defined iff $\alpha + \beta > 0$

Solution of Φ_3^4 equation

Solution is defined as limit of renormalised equations

$$\partial_t \Phi_\varepsilon = \Delta \Phi_\varepsilon + C_\varepsilon \Phi_\varepsilon - \Phi_\varepsilon^3 + \xi_\varepsilon$$

- ξ_{ε} is a mollification of ξ so that $\xi_{\varepsilon} \to \xi$ as $\varepsilon \to 0$
- C_{ε} are renormalisation constants such that $C_{\varepsilon} \to \infty$

Notion of solution was provided by

- Hairer '13 (regularity structures)
- Catellier, Chouk '13 (paracontrolled distributions)
- Kupiainen '15 (renormalisation group techniques)

The Φ_3^4 measure

• Approximation of Φ_3^4 measure on dyadic lattice $\mathbb{Z}^3_{\varepsilon} = (\varepsilon \mathbb{Z})^3$:

$$\mu_{\varepsilon}(d\Phi_{\varepsilon}) \sim e^{-S_{\varepsilon}(\Phi_{\varepsilon})} \prod_{x \in \mathbb{Z}^3_{\varepsilon}} d\Phi_{\varepsilon}(x)$$

• S_{ε} acts on functions $\Phi_{\varepsilon} \in \mathbb{R}^{\mathbb{Z}^3_{\varepsilon}}$ by

$$S_{\varepsilon}(\Phi_{\varepsilon}) = \frac{\varepsilon}{2} \sum_{x \sim y} \left(\Phi_{\varepsilon}(x) - \Phi_{\varepsilon}(y) \right)^2 - \frac{C_{\varepsilon}\varepsilon^3}{2} \sum_{x \in \mathbb{Z}^3_{\varepsilon}} \Phi_{\varepsilon}(x)^2 + \frac{\varepsilon^3}{4} \sum_{x \in \mathbb{Z}^3_{\varepsilon}} \Phi_{\varepsilon}(x)^4$$

• Formally $S_{\varepsilon}(\Phi_{\varepsilon})$ is a finite difference approximation of

$$S(\Phi) = \frac{1}{2} \int_{\mathbb{R}^3} \left(\nabla \Phi(x) \right)^2 dx - \frac{\infty}{2} \int_{\mathbb{R}^3} \Phi(x)^2 dx + \frac{1}{4} \int_{\mathbb{R}^3} \Phi(x)^4 dx$$

Park '**75:** the Φ_3^4 measure μ is given by $\mu_{\varepsilon} \Rightarrow \mu$ on \mathcal{S}'

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Our strategy of proof

Brydges, Fröhlich, Sokal '83: Moment bounds for μ_{ε} , implying $\mu_{\varepsilon} \Rightarrow \mu$ on $C^{-\frac{1}{2}-}$

Our strategy of proof:

1. Consider spatial discretisations with invariant measures μ_{ε} :

$$\partial_t \Phi_\varepsilon = \Delta_\varepsilon \Phi_\varepsilon + C_\varepsilon \Phi_\varepsilon - \Phi_\varepsilon^3 + \xi_\varepsilon$$

- 2. Prove that $\Phi_{\varepsilon} \to \Phi$ in $\mathcal{C}([0,T], \mathcal{C}^{-\frac{1}{2}-})$ if $\Phi_{\varepsilon}(0) \to \Phi(0)$ in $\mathcal{C}^{-\frac{1}{2}-}$
- 3. Take initial conditions $\Phi_{\varepsilon}(0) \sim \mu_{\varepsilon}$ and $\Phi(0) \sim \mu$. Conclude from $\Phi_{\varepsilon}(0) \rightarrow \Phi(0)$ that μ is invariant for Φ_3^4 equation (argument à la Bourgain '94 for non-linear Schrödinger equation)

Remark: $\Phi_{\varepsilon}(0) \to \Phi(0)$ in S' is not sufficient. The result by BFS is important!

Discrete Φ_3^4 equation

Consider periodic spatial discretisations of Φ_3^4 equation

$$d\Phi_{\varepsilon}(t,x) = \left(\Delta_{\varepsilon}\Phi_{\varepsilon} + C_{\varepsilon}\Phi_{\varepsilon} - \Phi_{\varepsilon}^{3}\right)(t,x)dt + \varepsilon^{-\frac{3}{2}}dW_{\varepsilon}(t,x)$$

on $t \in \mathbb{R}_+$ and $x \in \mathbb{Z}^3_{\varepsilon}$ (dyadic grid), where

• Δ_{ε} is nearest-neighbour discrete Laplacian

$$\Delta_{\varepsilon} \Phi_{\varepsilon}(x) = \varepsilon^{-2} \sum_{y \sim x} \left(\Phi_{\varepsilon}(y) - \Phi_{\varepsilon}(x) \right)$$

(日) (日) (日) (日) (日) (日) (日)

► $W_{\varepsilon}(\cdot, x), x \in \mathbb{Z}^3_{\varepsilon}$, are independent (up to periodicity) Brownian motions

Fact: μ_{ε} is an invariant measure for this equation

Convergence of discretised Φ_3^4 equations

Theorem (Hairer, M. '15)

We assume that

- Φ is the unique maximal solution of Φ_3^4 on $[0, T^*)$
- $\|\Phi_{\varepsilon}(0) \Phi(0)\|_{\mathcal{C}^{\eta}} \to 0$ almost surely for some $\eta > -\frac{2}{3}$

Then for every $\alpha < -\frac{1}{2}$

- ▶ there is a sequence $C_{\varepsilon} \sim \varepsilon^{-1}$ of renormalisation constants
- ► there is a sequence of stopping times T_{ε} satisfying $\lim_{\varepsilon \to 0} T_{\varepsilon} = T^*$ in probability

such that one has the limit in probability

$$\lim_{\varepsilon \to 0} \|\Phi_{\varepsilon} - \Phi\|_{\mathcal{C}_{\bar{\eta}}([0, T_{\varepsilon}], \mathcal{C}^{\alpha})} = 0$$

for some blow-up rate $\bar{\eta}$ at t = 0

Zhu, Zhu '15: The convergence result using paracontrolled distributions

Remarks:

Need a framework for spatial discretisations of rough SPDEs

• Want to work in spaces $\mathcal{C}([0,T],\mathcal{C}^{\alpha})$

Discrete models

For a regularity structure (T, G) a discrete model $(\Pi^{\varepsilon}, \Gamma^{\varepsilon}, \Sigma^{\varepsilon})$ consists of

- linear maps $\Pi_x^{\varepsilon,t}: \mathcal{T} \to \mathbb{R}^{\mathbb{Z}^d_{\varepsilon}}$ for $t \in \mathbb{R}, x \in \mathbb{Z}^d_{\varepsilon}$
- maps $\Gamma_{xy}^{\varepsilon,t} \in \mathcal{G}$ for $t \in \mathbb{R}$ and $x, y \in \mathbb{Z}_{\varepsilon}^{d}$ such that

 $\Gamma_{xx}^{\varepsilon,t} = 1 \qquad \Gamma_{xy}^{\varepsilon,t} \Gamma_{yz}^{\varepsilon,t} = \Gamma_{xz}^{\varepsilon,t} \qquad \Pi_{y}^{\varepsilon,t} = \Pi_{x}^{\varepsilon,t} \Gamma_{xy}^{\varepsilon,t}$

• maps
$$\Sigma_x^{\varepsilon,st} \in \mathcal{G}$$
 for $s, t \in \mathbb{R}$ and $x \in \mathbb{Z}_{\varepsilon}^d$ such that
 $\Sigma_x^{\varepsilon,tt} = 1$ $\Sigma_x^{\varepsilon,sr} \Sigma_x^{\varepsilon,rt} = \Sigma_x^{\varepsilon,st}$ $\Sigma_x^{\varepsilon,st} \Gamma_{xy}^{\varepsilon,t} = \Gamma_{xy}^{\varepsilon,s} \Sigma_y^{\varepsilon,st}$

For $x, y \in \mathbb{Z}^d_{\varepsilon}$, all test-functions φ and locally uniformly in time:

$$\begin{split} |\langle \Pi_x^{\varepsilon,t}\tau,\varphi_x^\lambda\rangle_\varepsilon| &\lesssim \lambda^{|\tau|} , \qquad \lambda \in [\varepsilon,1] \\ \|\Gamma_{xy}^{\varepsilon,t}\tau\|_m &\lesssim |x-y|^{|\tau|-m} \qquad \|\Sigma_x^{\varepsilon,st}\tau\|_m \lesssim \left(|t-s|^{\frac{1}{2}}\vee\varepsilon\right)^{|\tau|-m} \end{split}$$

Relation to original models

We can define models (Π, Γ, Σ) on \mathbb{R}^d as $\varepsilon = 0$

If $(\tilde{\Pi},\tilde{\Gamma})$ is the original model on $\mathbb{R}^{d+1},$ then

• $\tilde{\Gamma}$ is equivalent to the pair (Γ, Σ) :

$$\tilde{\Gamma}_{(t,x),(s,y)} = \Gamma^t_{xy} \Sigma^{ts}_y = \Sigma^{ts}_x \Gamma^s_{xy}$$
$$\Gamma^t_{xy} = \tilde{\Gamma}_{(t,x),(t,y)} \qquad \Sigma^{st}_x = \tilde{\Gamma}_{(s,x),(t,x)}$$

► From ÎÎ to Π (formally):

$$\left(\Pi_x^t \tau\right)(y) = \left(\tilde{\Pi}_{(t,x)} \tau\right)(t,y)$$

Remark: Π_x^t contains "less information" than $\tilde{\Pi}_{(t,x)}$ From Π to $\tilde{\Pi}$:

$$\left(\tilde{\Pi}_{(t,x)}\tau\right)(s,y) = \left(\Pi_x^s \Sigma_x^{st}\tau\right)(y)$$

(日) (日) (日) (日) (日) (日) (日)

Discrete modeled distributions

• $H^{\varepsilon}: (0,T] \times \mathbb{Z}^{d}_{\varepsilon} \to \mathcal{T}$ is a modelled distribution from $\mathcal{D}^{\eta,\gamma}_{T,\varepsilon}$ if

$$\begin{split} \|H_t^{\varepsilon}(x)\|_m &\lesssim (t\vee\varepsilon^2)^{\frac{(\eta-m)\wedge0}{2}}, \quad m<\gamma\\ \|H_t^{\varepsilon}(x) - \Gamma_{xy}^{\varepsilon,t}H_t^{\varepsilon}(y)\|_m &\lesssim (t\vee\varepsilon^2)^{\frac{\eta-\gamma}{2}}|x-y|^{\gamma-m}\\ \|H_t^{\varepsilon}(x) - \Sigma_x^{\varepsilon,ts}H_s^{\varepsilon}(x)\|_m &\lesssim (s\vee t\vee\varepsilon^2)^{\frac{\eta-\gamma}{2}} \left(|t-s|^{\frac{1}{2}}\vee\varepsilon\right)^{\gamma-m} \end{split}$$

The discrete reconstruction map

 $\left(\mathcal{R}^{\varepsilon}H^{\varepsilon}\right)_{t}(x) = \left(\Pi_{x}^{\varepsilon,t}H_{t}^{\varepsilon}(x)\right)(x) , \qquad (t,x) \in (0,T] \times \mathbb{Z}_{\varepsilon}^{d}$

Discrete reconstruction theorem

For all $(t, x) \in (0, T] \times \mathbb{Z}_{\varepsilon}^{d}$ and all test functions φ one has

 $|\langle \left(\mathcal{R}^{\varepsilon}H^{\varepsilon}\right)_{t} - \Pi_{x}^{\varepsilon,t}H_{t}^{\varepsilon}(x), \varphi_{x}^{\lambda}\rangle_{\varepsilon}| \lesssim \lambda^{\gamma}(t \vee \varepsilon^{2})^{\frac{\eta-\gamma}{2}}, \qquad \lambda \in [\varepsilon, 1]$

Remark: The proof requires a discrete analogue of wavelets

Discrete heat kernel

• The discrete heat kernel on $(t, x) \in \mathbb{R} \times \mathbb{Z}^d_{\varepsilon}$:

$$G_t^{\varepsilon}(x) = \varepsilon^{-d} \mathbf{1}_{t \ge 0} \left(e^{t\Delta_{\varepsilon}} \delta_{0, \cdot} \right)(x)$$

where δ is Kronecker's delta

• Replacing $\delta_{0,.}$ by a suitable smooth function we write

• For
$$\varepsilon = 2^{-N}$$
 we expand K^{ε} as

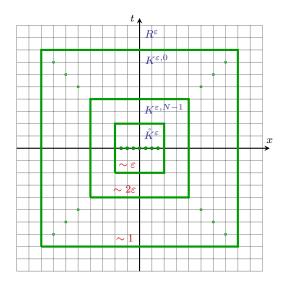

$$K^{\varepsilon} = \underbrace{\mathring{K}^{\varepsilon}}_{\text{discrete}} + \underbrace{\bar{K}^{\varepsilon}}_{\mathcal{C}^{\infty}} = \mathring{K}^{\varepsilon} + \sum_{n=0}^{N-1} K^{\varepsilon,n}$$

• in such a way that for some c > 0:

 $\operatorname{supp}(\mathring{K}^{\varepsilon}) \subset \operatorname{Box}(0, c\varepsilon)$ $\operatorname{supp}(K^{\varepsilon, n}) \subset \operatorname{Box}(0, c2^{-n})$

 $\begin{aligned} |\mathring{K}^{\varepsilon}(z)| &\lesssim \varepsilon^{-d} \\ |D^k K^{\varepsilon,n}(z)| &\lesssim 2^{(d+|k|)n} \end{aligned}$

Abstract integration

Let $\mathcal{I}: \mathcal{T} \to \mathcal{T}$ be an abstract integration map, i.e. $\mathcal{I}: \mathcal{T}_{\alpha} \to \mathcal{T}_{\alpha+2}$

Our aim: To define $\Pi^{\varepsilon} \mathcal{I} \tau$, $\Gamma^{\varepsilon} \mathcal{I} \tau$ and $\Sigma^{\varepsilon} \mathcal{I} \tau$ by $\Pi^{\varepsilon} \tau$, $\Gamma^{\varepsilon} \tau$, $\Sigma^{\varepsilon} \tau$ and K^{ε}

- We define $(\Pi_x^{\varepsilon,t} \mathcal{I}\tau)(y) = \int_{\mathbb{R}} \langle \Pi_x^{\varepsilon,s} \Sigma_x^{\varepsilon,st} \tau, K_{t-s}^{\varepsilon}(y-\cdot) \rangle_{\varepsilon} ds - \underbrace{\Pi_x^{\varepsilon,t} \left(\mathcal{J}_{t,x}^{\varepsilon} \tau \right)(y)}_{\text{polynomial}}$
- where the polynomial part is given by

$$\mathcal{J}_{t,x}^{\varepsilon}\tau = \mathbf{1} \int_{\mathbb{R}} \langle \Pi_{x}^{\varepsilon,s} \Sigma_{x}^{\varepsilon,st} \tau, \mathring{K}_{t-s}^{\varepsilon}(x-\cdot) \rangle_{\varepsilon} ds \\ + \sum_{|k| < |\tau|+2} \frac{X^{k}}{k!} \int_{\mathbb{R}} \langle \Pi_{x}^{\varepsilon,s} \Sigma_{x}^{\varepsilon,st} \tau, D^{k} \bar{K}_{t-s}^{\varepsilon}(x-\cdot) \rangle_{\varepsilon} ds$$

• Furthermore, we assume

 $\Gamma_{xy}^{\varepsilon,t} \left(\mathcal{I} + \mathcal{J}_{t,y}^{\varepsilon} \right) = \left(\mathcal{I} + \mathcal{J}_{t,x}^{\varepsilon} \right) \Gamma_{xy}^{\varepsilon,t} ,$

$$\Sigma_x^{\varepsilon,st} \left(\mathcal{I} + \mathcal{J}_{t,x}^{\varepsilon} \right) = \left(\mathcal{I} + \mathcal{J}_{s,x}^{\varepsilon} \right) \Sigma_x^{\varepsilon,st}$$

(日) (日) (日) (日) (日) (日) (日)

Abstract integration, cont.

• To get the required estimates we write

$$\big(\Pi_x^{\varepsilon,t} \mathcal{I}\tau \big)(y) = \underbrace{\int_{\mathbb{R}} \langle \Pi_x^{\varepsilon,s} \Sigma_x^{\varepsilon,st}\tau, \mathring{K}_{t-s}^{\varepsilon}(y-\cdot) \rangle_{\varepsilon} ds}_{=(\widehat{\Pi}_x^{\varepsilon,t} \mathcal{I}\tau)(y)} + \underbrace{(\overline{\Pi}_x^{\varepsilon,t} \mathcal{I}\tau)(y)}_{=(\widehat{\Pi}_x^{\varepsilon,t} \mathcal{I}\tau)(y)}$$

• $\langle \bar{\Pi}_x^{\varepsilon,t} \mathcal{I}\tau, \varphi_x^{\lambda} \rangle_{\varepsilon}$ is bounded similarly to continuous case and $\left| \langle \mathring{\Pi}_x^{\varepsilon,t} \mathcal{I}\tau, \varphi_x^{\lambda} \rangle_{\varepsilon} \right| \lesssim \varepsilon^{|\tau|+2} \lesssim \lambda^{|\tau|+2} ,$

if $|\tau| + 2 > 0$ and $\lambda \ge \varepsilon$. Moreover,

$$\begin{split} \left| \langle (\mathring{\Pi}_x^{\varepsilon,t} - \mathring{\Pi}_x^{\varepsilon,s}) \mathcal{I}\tau, \varphi_x^{\lambda} \rangle_{\varepsilon} \right| &\leq \quad \left| \langle \mathring{\Pi}_x^{\varepsilon,t} \mathcal{I}\tau, \varphi_x^{\lambda} \rangle_{\varepsilon} \right| + \left| \langle \mathring{\Pi}_x^{\varepsilon,s} \mathcal{I}\tau, \varphi_x^{\lambda} \rangle_{\varepsilon} \right| \\ &\lesssim \quad \varepsilon^{|\tau|+2} \lesssim \lambda^{|\tau|+2-\delta} \big(|t-s|^{\frac{1}{2}} \vee \varepsilon \big)^{\delta} \end{split}$$

• Somewhat similarly we can build a map $\mathcal{K}^{\varepsilon}_{\gamma}: \mathcal{D}^{\eta,\gamma}_{T,\varepsilon} \to \mathcal{D}^{\eta+2,\gamma+2}_{T,\varepsilon}$ s.t.

$$\mathcal{R}_t^{\varepsilon} \big(\mathcal{K}_{\gamma}^{\varepsilon} H^{\varepsilon} \big)_t(x) = \int_0^t \langle \mathcal{R}_s^{\varepsilon} H_s^{\varepsilon}, K_{t-s}^{\varepsilon}(x-\cdot) \rangle_{\varepsilon} ds$$

(日) (日) (日) (日) (日) (日) (日)

Analysis of discretised SPDEs

Consider spatial discretisations of a locally subcritical equation

 $\partial_t u_{\varepsilon} = \Delta_{\varepsilon} u_{\varepsilon} + F_{\varepsilon}(u_{\varepsilon}, \xi_{\varepsilon}) , \qquad u_{\varepsilon}(0) = u_{\varepsilon}^0$

Algorithm:

- 1. Build a regularity structure $(\mathcal{T}, \mathcal{G})$ (as in continuous case)
- 2. Remove elements from \mathcal{T} which do not correspond to functions in time, e.g. Ξ corresponds to ξ_{ε}
- 3. Lift canonically ξ_{ε} to a discrete model $Z^{\varepsilon} = (\Pi^{\varepsilon}, \Gamma^{\varepsilon}, \Sigma^{\varepsilon})$
- 4. Reformulate the equation

$$U^{\varepsilon} = \mathcal{K}^{\varepsilon}_{\gamma} F_{\varepsilon}(U^{\varepsilon}, \Xi) + \underbrace{\text{polynomial}}_{\text{comes from } u^{0}_{\varepsilon} \text{ and } R^{\circ}}$$

where U^{ε} is a modeled distribution and

$$u_{\varepsilon}(t,x) = \left(\mathcal{R}^{\varepsilon}U^{\varepsilon}\right)_t(x)$$

- 5. Show that $u^0_{\varepsilon} \to u^0$ and $Z^{\varepsilon} \to Z$ (after renormalisation)
- 6. Conclude that $U^{\varepsilon} \to U$ in $\mathcal{D}_{T,\varepsilon}^{\eta,\gamma}$ (fixed point argument) and $u_{\varepsilon} \to u$

Conclusions and outlooks

Conclusions:

- The Φ_3^4 measure is invariant for the Φ_3^4 equation
- ► For almost every (wrt Φ⁴₃ measure) initial condition, the solution to Φ⁴₃ equation is almost surely global in time
- The framework can be applied to many rough SPDEs, incl. KPZ, Burgers, parabolic Anderson etc.

Question:

What about non-Gaussian and non-stationary noise, e.g. martingale-driven equations coming from particle systems?
